IN THE CLAIMS:

Kindly replace the claims of record with the following full set of claims:

1. (Original) A method for providing user data pertaining to a user of a mobile terminal (104) to a recommender system (168) of a consumer electronic device (164), the method comprising the steps of:

determining, by the terminal, a current location of the terminal (208, 236, 248), wherein said current location is determined after receiving a initiating signal, said initiating signal being one of a user input and a received signal;

saving, in the terminal, an identifier of the determined location (316, 240, 252), based on a longevity of said terminal in an area proximate said current location; and

informing, by means of the terminal, said recommender system of a consumer electronic device of the determined location (124, 156, 160).

2. (Currently amended)The method of claim 1, wherein said terminal further includes ~~has~~ an input device (136), said input device providing means for providing said initiating signal. ~~said determining being triggered by said user actuating said input device~~.

3. (Currently amended) The method of claim 1, wherein said received signal causes said terminal to execute the steps of: ~~the terminal includes a timer (116), said determining step comprises the steps of:~~

~~detecting, by said terminal, a signal from a mobile terminal network (132, 156);~~

recognizing, from the signal, whether said determined location is outside a predefined home territory of the user (204); and

if it is recognized that the terminal is outside the home territory, automatically and without intervention by the user other than moving the terminal to a different location, initiating a timer (116) for starting a first predetermined time period ~~as measured by means of said timer (216)~~.

4. (Original) The method of claim 3, wherein the current location determined in the determining step changes in correspondence with movement of the terminal, said current location comprising at any moment a region and a sub-region within the region (236, 248), the region and sub-region being discernible by the terminal from the signal, the starting step further comprising the step of monitoring said signal to determine whether at least one of the region and the sub-region stays constant over said first predetermined time period (220).

5. (Original) The method of claim 4, wherein the monitoring step comprises the steps of:

monitoring said signal to determine whether the region stays constant over said first predetermined time period (236); and

monitoring said signal to determine whether the sub-region stays constant over a second predetermined time period (248).

6. (Original) The method of claim 5, wherein, if it is determined that the region has stayed constant over said first predetermined time period, the saving step further comprises the step of saving the region as an identifier (240) and the informing step comprises the step of informing the recommender system of said region (156, 160).

7. (Original) The method of claim 6, wherein, if it is determined that both the region and the sub-region have stayed constant over the first and second predetermined time periods respectively, the saving step further comprises the step of saving the sub-region as an identifier (228) and the informing step comprises the step of informing the recommender system of said sub-region (156, 160).

8. (Original) The method of claim 4, wherein the monitoring step comprises the steps of:

monitoring said signal to determine whether the region stays constant over said first predetermined time period (320); and

while the region monitoring determines that the region has stayed constant, monitoring the sub-region to measure for what length of time the sub-region stays constant, to detect any change from said sub-region to a new sub-region (236, 248) and to measure for what length of time the new sub-region stays constant (252, 356).

9. (Original) The method of claim 1, wherein the determining, saving and informing steps are initiated automatically by the terminal without intervention by the user other than moving the terminal to a different location (124, 204, 220, 224, 236, 248).

10. (Currently amended) A mobile terminal for providing user data pertaining to a user of said terminal to a recommender system (168) of a consumer electronic device (164), the apparatus comprising:

a memory (128);

a transmitter (120);

a receiver configured for receiving a wireless signal (120, 156); and

a processor (112) for:

determining, ~~from the received signal,~~ a current location of the terminal (204), wherein said current location is determined after receiving a initiating signal, said initiating signal being one of a user input and a received signal;

saving an identifier of the determined location to said memory (216) based on a longevity of said terminal in an area proximate said current location; and

informing (124), by means of said transmitter, said recommender system of a consumer electronic device of the determined location.

11. (Currently amended) The terminal of claim 10, wherein said terminal further comprises an input device (136), said input device providing means for providing said initiating signal. ~~and is further configured so that said determining is triggered by said user actuating said input device.~~

12. (Currently amended) The terminal of claim 10, further comprising a timer (116), ~~wherein said signal has been transmitted from a mobile terminal network,~~ the processor being further configured for ~~detecting said signal (120, 156),~~ recognizing, from the signal, whether said determined location is outside a predefined home territory of the user and (204), if it is recognized that the terminal is outside the home territory, automatically and without intervention by the user other than moving the terminal to a different location, starting a first predetermined time period (216) as measured by means of said timer.

13. (Original) The terminal of claim 12, wherein the current location to be determined by the processor changes in correspondence with movement of the terminal, said current location comprising at any moment a region and a sub-region within the region (216), the processor being configured for discerning the region and sub-region from the signal and for monitoring said signal to determine whether at least one of the region and the sub-region stays constant over said first predetermined time period (236, 248).

14. (Original) The terminal of claim 13, the processor being further configured for:

monitoring said signal to determine whether the region stays constant over a first predetermined time period (236); and

monitoring said signal to determine whether the sub-region stays constant over a second predetermined time period (248).

15. (Original) The terminal of claim 14, the processor being further configured for, if it is determined that the region has stayed constant over said first predetermined time period, saving the region as an identifier (240) and informing the recommender system of said region (124, 156, 160).

16. (Original) The terminal of claim 15, the processor being further configured for, if it is determined that both the region and the sub-region have stayed constant over the first and second predetermined time periods respectively, saving the sub-region as an identifier (228) and informing the recommender system of said sub-region (124, 156, 160).

17. (Original) The terminal of claim 13, the processor being further configured for monitoring said signal to determine whether the region stays constant over a first predetermined time period (236), and, while determining that the region has stayed constant, monitoring the sub-region to measure for what length of time the sub-region stays constant (248), to detect any change from said sub-region to a new sub-region and to measure for what length of time the new sub-region stays constant (252, 356).

18. (Original) The terminal of claim 10, the processor being further configured for initiating said determining, saving and informing automatically without intervention by the user other than moving the terminal to a different location (124, 204, 220, 224, 236, 248).

19. (Original) The terminal of claim 10, wherein said terminal comprises a mobile phone (104).
